"Mineralogical, petrological and geochemical studies of different varieties of serpentinites from northern Vietnam".

Dissertation thesis:

- Mineral composition, and in particular serpentine minerals and their mutual quantitative relations, are an indicator of the nature of the processes associated with the formation of serpentinites from northern Vietnam;
- The transformation processes of studied serpentinites are manifested in the richness of the products of their transformations;
- The protolith type of studied serpentinites remains in close correlation with the chemical composition of these rocks.
