In this work, surface-enhanced Raman spectroscopy (SERS) was used to detect phenol in water. CuO nanowires were prepared by thermal oxidation method. Gold was covered on the prepared CuO nanowires by sputtering method. The shell layer thickness was controlled by tuning the sputtering time. The thickness was optimized to obtain the highest enhancement. The developed SERS substrates based on CuO/Au nanowires allow the detection of phenol at concentrations as low as 0.1  $\mu\text{g/L}$  and are a potential tool for the quick detection of phenol at trace level.

**Keywords:** CuO nanowires, core/shell structures, sputtering, surface enhanced Raman scattering (SERS).
