A REVIEW OF PROFESSIONAL DEVELOPMENT IN TERTIARY EDUCATION

Abstract

Professional Development (PD) in tertiary education plays a crucial role in enhancing teaching quality and supporting the continuous growth of faculty members. However, given the wide range of academic disciplines, faculty roles, and institutional contexts, there is no one-size-fits-all approach to PD. This paper reviews key PD models commonly used in higher education, classifying them into three main categories: traditional models, collaborative models, and technology-driven models. Each approach is examined in terms of its strengths, limitations, and applicability within university settings. Traditional PD models, while common, often provide short-term, one-off experiences that may lack long-term impact or adaptability to specific institutional needs. Collaborative models, such as Professional Learning Communities and peer coaching, emphasize ongoing engagement and peer-driven learning, fostering both individual and collective development. Technology-driven PD models offer flexibility and broader access, but their success is contingent upon institutional support and digital competence. This paper provides a comprehensive analysis of diverse PD models and their relevance in a rapidly evolving educational landscape. The findings of the study provide valuable insights for university leaders, academic developers, and policymakers, advocating for a blended PD strategy that integrates traditional, collaborative, and technology-enhanced methods to enhance faculty development and institutional advancement.

Keywords:

PD, tertiary education, collaborative learning, technology-driven PD.

1. Introduction

In the rapidly growing landscape of higher education, the Professional Development (PD) of academic staff has become a vital component in enhancing teaching quality, student learning outcomes, and institutional innovation. As universities respond to increasing demands for responsibility, digital transformation, and pedagogy, the need for effective, sustainable, and context-based PD models has increased. Unlike the school sector, where structured PD frameworks are often mandated, tertiary education presents unique challenges and opportunities due to its diverse disciplines, autonomous work cultures, and varied faculty roles. Consequently, PD in this context must be both flexible and strategically aligned with institutional priorities.

This paper offers a comprehensive review of key PD models commonly applied in tertiary education, categorizing them into three broad types: traditional models, collaborative and reflective models, and

technology-driven models. Traditional approaches such as workshops, seminars, conferences, and formal courses provide foundational learning experiences, while models like Professional Learning Communities (PLCs), Lesson Study, Peer coaching and mentoring emphasize sustained collaboration and reflective practice. In parallel, technology-enhanced PD, including online platforms, blended learning, and digital professional networks, has introduced greater accessibility and adaptability to academic development. By analyzing different approaches to professional learning, this study aims to provide insights into best practices for enhancing educator competencies and fostering a culture of continuous improvement in educational institutions

2. The Concepts of Professional Development

Professional Development is a multifaceted and ongoing process that aims to enhance individuals' knowledge, skills, and practices in their professional roles. PD is crucial for teachers to stay current with advancements in pedagogy, subject knowledge, and instructional technologies. It also fosters their ability to respond effectively to the evolving needs of learners and educational institutions. Various scholars have defined PD from different perspectives. Day (1999) describes it as *"all natural learning experiences and those conscious and planned activities that are intended to be of direct or indirect benefit to the individual, group, or school, which contribute to the quality of education in the classroom"* (p.4). This definition highlights both formal and informal learning opportunities and their impact on teaching and learning outcomes. Guskey (2000) defines PD as *"those processes and activities designed to enhance the professional knowledge, skills, and attitudes of educators so that they might improve the learning of students"* (p.16). His definition underscores the connection between teacher learning and student outcomes, emphasizing that the ultimate goal of PD is to improve educational quality. Kennedy (2014) provides a broader perspective by categorizing PD into nine distinct models, each with specific theoretical and practical implications. She emphasizes the complexity of PD, noting that its design and delivery must align with contextual goals and the power dynamics between teachers and external stakeholders. Darling-Hammond et al. (2017) define PD as *"structured professional learning that results in changes in teacher practices and improvements in student learning outcomes"* (p.2). This definition emphasizes the structured and intentional nature of PD, along with its dual focus on teacher practices and student achievement.

Definitions of PD offered by various scholars highlight both shared goals and unique perspectives. A common thread among these definitions is the central aim of PD: to enhance teaching practices and, in turn, improve student learning outcomes. Scholars like Guskey (2000) and Darling-Hammond (2017) emphasize this outcome-driven approach, underlining the importance of linking PD directly to student achievement. Others, such as Day (1999) and Kennedy (2014), offer broader views that reflect the complexity and diversity of PD in practice. Day (1999) acknowledges that professional growth can occur through both formal and informal experiences, recognizing the many ways educators learn. Meanwhile, Kennedy's framework highlights the importance of aligning PD approaches with specific educational contexts, reinforcing the idea that effective professional learning must be adaptable and responsive to individual and institutional needs.

3. Models of Professional Development in Education

PD models have been widely studied, with scholars emphasizing the importance of structured and collaborative learning approaches (Guskey, 2002; Desimone, 2009). PD models can be categorized into three main types: traditional, collaborative, and technology-driven.

3.1. Traditional Models of Professional Development

Traditional PD models, such as *workshops, conferences, and seminars*, have long been used to enhance educators' skills and knowledge. These models typically involve structured, expert-led sessions that provide theoretical and practical insights into specific teaching methodologies or subject areas. Workshops and seminars offer educators opportunities to gain new knowledge within a short time frame, and they are

effective in introducing new concepts. *Course-based PD*, such as degree programs, enhances content knowledge but requires substantial time and financial investment (Avalos, 2011). *Conferences* foster networking and knowledge exchange, though their long-term impact depends on implementation strategies. However, traditional models often lack sustained follow-up and practical application. They can be passive and may not lead to long-term changes in teaching behavior (Guskey, 2002).

3.2. Collaborative Models of Professional Development

Collaborative PD models focus on peer interaction, shared learning experiences, and ongoing support among educators. These models foster deeper engagement and provide opportunities for collective problem-solving and reflection. *Professional Learning Communities (PLCs)* involve educators working together to analyze student performance, refine teaching strategies, and reflect on instructional practices (DuFour & Eaker, 1998). PLCs foster a sense of community, promote sustained inquiry, and align closely with school goals. They support job-embedded learning and collective responsibility for student outcomes. However, effective PLCs require time, trust, and strong leadership. Without a collaborative culture, PLCs may become superficial or dominated by a few voices (Hargreaves & Fullan, 2012). *Lesson study*, a model originating from Japan, allows educators to collaboratively design, teach, and analyze lessons for continuous improvement (Lewis, 2002). *Peer Coaching and Mentoring* models involve experienced educators providing guidance, feedback, and support to their peers. Peer coaching allows for real-time reflection and adjustment of teaching practices, leading to improved classroom effectiveness (Hargreaves & Fullan, 2012). Mentoring, particularly for new faculty members, helps ease the transition into academia and fosters a culture of professional support. Peer coaching allows for contextualized learning and continuous feedback. However, success depends heavily on the quality of the mentor-mentee relationship and institutional recognition of mentoring efforts.

3.3. Technology-Driven Models of Professional Development

The rapid integration of digital technologies into education has given rise to technology-driven PD models, which offer flexible and accessible learning opportunities for educators.

With advancements in digital learning, technology-driven PD has become increasingly common. Online courses and webinars provide flexible learning opportunities through platforms like Coursera and EdX. E-coaching and virtual mentoring offer real-time feedback from experts worldwide (Knight, 2011). Social media and Professional Learning Networks (PLNs) enable educators to engage in ongoing discussions, access new research, and share best practices. While these models offer accessibility and scalability, they require self-discipline and digital literacy for effective implementation. Table 1 below shows the synthesis of different PD models.

Table 1

An Overview of Professional Development Models

PD Model Type	Description	Examples	Strengths	Limitations
Traditional Models	Expert-led, structured learning sessions.	Workshops, seminars, formal courses	Clear objectives, expert guidance, institutional recognition	One-size-fits-all, limited customization, often passive learning
Collaborative Models	Peer interaction and shared learning experiences.	PLCs, peer coaching, mentoring, lesson study	Active engagement, professional dialogue, cultural change	Time-intensive, facilitator-dependent, needs institutional alignment
Technology-Driven Models	Flexible learning using digital tools and platforms.	Online courses, webinars, e-coaching, PLNs	Accessible, cost-effective, scalable, self-paced	Requires digital literacy, risk of shallow learning, limited contextualization

4. The Application of Professional Development Models in Tertiary Education

PD in tertiary education is increasingly recognized as a critical factor in enhancing teaching quality,

academic leadership, and institutional effectiveness. While PD has long been emphasized in school settings, its application in higher education requires context-based models that account for the diverse roles, workloads, and disciplines of academic staff. Traditional PD models such as workshops, seminars, conferences, and course-based learning have formed the foundation of many institutional strategies. However, evolving educational demands and technological advancements have prompted a shift toward more collaborative, reflective, and technology-integrated approaches. An effective application of PD in tertiary education demands a balanced integration of various models to address both individual faculty needs and broader institutional goals.

Traditional PD models retain certain advantages in the university context. Workshops and seminars, for instance, offer focused, short-term learning on specific topics such as curriculum design, assessment, or digital tools. They are relatively easy to organize and can engage a wide audience (Desimone, 2009). Conferences provide exposure to cutting-edge research and enable faculty to connect with peers globally, thus fostering academic networks and scholarly engagement (Kennedy, 2016). Course-based PD, such as postgraduate certificates in teaching and learning, allows for deeper engagement and credentialing, which can support career development (Avalos, 2011). However, these models often lack sustained impact due to their episodic nature and limited opportunities for contextual application, particularly when they are not embedded in day-to-day academic practice (Garet et al., 2001). Furthermore, faculty may experience time and workload constraints that hinder participation, reducing the long-term effectiveness of these traditional approaches.

In contrast, collaborative and reflective models such as Professional Learning Communities (PLCs), Lesson Study, Peer coaching and mentoring have emerged as more sustainable and context-responsive forms of PD. These models promote continuous learning, peer interaction, and reflective dialogue, which are essential for meaningful pedagogical change (Vescio et al., 2008). PLCs, for example, allow university departments or cross-disciplinary groups to engage in collective inquiry around student outcomes, curriculum innovation, or inclusive teaching practices (DuFour, 2004). Similarly, peer coaching and mentoring foster reciprocal learning relationships, which can be particularly beneficial for early-career academics navigating complex institutional environments (Trowler & Knight, 2000; Hobson et al., 2009). Lesson Study, though less common in higher education, offers a structured and evidence-based process for improving teaching through collaborative lesson planning and analysis (Lewis et al., 2006). Despite their promise, these models require significant institutional support, including time allocation, leadership confirmation, and capacity-building for facilitators to ensure effective implementation.

Technology-driven PD models further expand the scope of faculty development by offering flexibility, personalization, and scalability. Online learning platforms, webinars, and digital communities of practice provide asynchronous, accessible learning opportunities tailored to faculty interests and availability (Dede et al., 2009). Blended models, which combine face-to-face learning with digital components, have been particularly effective in promoting sustained engagement and contextual application in higher education (Owston et al., 2008). Moreover, social media and online professional networks enable academics to connect globally, share resources, and engage in continuous learning beyond institutional boundaries (Trust et al., 2016). Nevertheless, disparities in digital literacy, limited institutional support for online PD, and a lack of structured design can undermine their impact. Effective use of technology-driven models in tertiary education requires alignment with pedagogical goals, robust instructional design, and recognition of informal learning pathways.

In summary, the effective application of PD models in tertiary education depends on a strategic and integrated approach that aligns with the complex roles and needs of academic staff. Traditional models offer foundational learning opportunities, while collaborative, reflective, and technology-driven approaches foster

deeper, sustained engagement. Institutions must adopt a holistic view of PD that blends multiple models, supports institutional culture, and provides structural conditions, such as time, leadership, and resources, that enable faculty to engage meaningfully in their professional growth. Only through such an integrated approach can PD in higher education contribute to improved teaching quality, student outcomes, and institutional innovation.

5. Conclusion

The paper has highlighted the evolving landscape of PD in tertiary education, underscoring the need for a multidimensional and responsive approach to faculty learning. Traditional models such as workshops, seminars, conferences, and formal courses continue to offer structured and accessible formats. However, their limitations, particularly in sustainability and contextual relevance, have prompted a growing interest in collaborative, reflective, and technology-driven alternatives. Models like PLCs, Lesson Study, Peer coaching and mentoring emphasize professional collaboration, inquiry, and practical application, aligning well with the complex pedagogical and institutional demands of higher education. Likewise, technology-enhanced PD offers increased flexibility and reach, although its effectiveness depends on thoughtful integration and adequate support systems.

The effective implementation of professional development in tertiary education requires careful attention to the unique characteristics of each institution such as its culture, workload expectations, and the diverse disciplines of its academic staff. Since no single PD model can meet all needs, a well-balanced combination of strategies is necessary. This blend should be supported by strong institutional leadership, adequate time for participation, and continuous evaluation to ensure its relevance and impact. To truly improve teaching quality, student outcomes, and drive innovation, universities must adopt a holistic approach to PD, one that integrates professional learning as a core, ongoing part of academic life. Future efforts should aim to build a strong culture of ongoing learning while exploring professional development practices that are practical, adaptable, and suited to the specific needs and challenges of higher education institutions.

EFFECTIVE TEACHING AND LEARNING: UNDERSTANDING THE RELATIONSHIP BETWEEN PEDAGOGY AND PSYCHOLOGY

Abstract

Pedagogy and psychology are two intertwined fields that greatly influence educational practices and outcomes. Pedagogy, the art and science of teaching, draws extensively from psychological theories and principles to enhance the learning experience. This article explores the relationship between pedagogy and psychology, focusing on how psychological insights contribute to effective teaching methods, learning strategies, and student development. It examines key psychological theories and their applications in the classroom, including behaviorism, cognitive psychology, and social learning theory. Furthermore, the paper discusses the role of psychological assessments, motivation, and emotional well-being in education. The integration of pedagogy and psychology not only improves instructional practices but also supports the holistic development of students, fostering academic success and personal growth.
